

YAZHI COLLECTION

Elegant Women's Boutique • Localhost Web Experience

Product Requirements Document (PRD)

Version 1.0 • Initial Landing + Collection Experience

Purpose: Define the complete first version of Yazhi Collection's boutique website so it can be built consistently in HTML, CSS and JavaScript using Antigravity and run on localhost.

Design direction: Premium, feminine, elegant, creative, image-led and easy to navigate. The interface should feel like a real boutique brand rather than a basic student project.

Current scope: Entry/glance screen → Home → Collections → Collection category → Collection type/product cards → Cart actions. Supporting navigation for profile, history, contact and social media is included in the information architecture.

1. Product Overview

Brand: Yazhi Collection

Website type: Women's clothing / boutique showcase and shopping-style website

Primary technology: HTML5, CSS3 and JavaScript

Development environment: Antigravity + VS Code

Execution target: Localhost

Primary audience: Women looking for bridal, festive, party, ethnic, saree, contemporary and customized fashion.

Core experience: Visitors first see a short visual brand glance/intro. After entering, they reach an elegant home page and can move smoothly into collections. Selecting a collection opens a dedicated page; selecting a collection type exposes products with descriptions, quantity controls, Add to Cart and Buy Now actions.

2. Goals

- Create a visually memorable first impression of Yazhi Collection.
- Present the boutique's collections in a clear hierarchy.
- Make navigation smooth, predictable and easy to access.
- Allow users to reach any major collection from the home page with minimal interaction.
- Give every collection type a clear visual identity using a reference image, title and tagline.
- Create a reusable product-card pattern with description, quantity, Add to Cart and Buy Now.
- Communicate that color/customization requests can be discussed with the boutique.
- Build a responsive foundation suitable for desktop, tablet and mobile screens.

3. Reference Design Analysis

Reference 1 — Saree e-commerce layout: Strong example of a premium hero area, category circles, featured/trending banners, best sellers, promotional banner, service highlights and a structured footer. Yazhi can adopt this content hierarchy while keeping its own brand identity.

Reference 2 — Boutique promotional poster: Uses decorative borders, warm blush/peach tones, gold accents, fashion imagery and clear category labels. This supports the idea of a feminine, festive and premium visual language.

Reference 3 — Friendly boutique storefront: Demonstrates a soft pink visual system, top announcement bar, simple navigation, large hero section, category cards, new arrivals and a newsletter area. The lesson for Yazhi is to keep the interface warm and approachable while avoiding excessive visual clutter.

Combined design direction for Yazhi: Use the strong e-commerce structure of Reference 1, the ornamental elegance of Reference 2 and the soft boutique atmosphere of Reference 3. Do not copy any reference layout, logo, text or imagery directly; use them only as visual inspiration.

4. Brand & Color Theory

Recommended palette: Deep Plum #4A234F, Wine/Rose #9B4D68, Soft Blush #F4DDE2, Warm Cream #F8F5ED, Antique Gold #C8A45D, Charcoal #2A2228.

Why this works: Plum/wine communicate luxury and depth; blush adds femininity and softness; cream prevents the site from feeling too dark; gold acts as a premium accent; charcoal keeps body text readable.

Usage rule: Avoid making every section the same color. Use cream/blush as the main visual base, deep plum/wine for hero/footer/major CTA areas, and gold sparingly for borders, icons, highlights and premium details. This creates contrast and visual rhythm.

Typography: Pair an elegant serif/display font for major headings with a clean sans-serif font for navigation, descriptions and buttons. Script fonts may be used only as small decorative accents, not for important body text.

5. Information Architecture / Site Map

Level	Page / Area	Purpose
1	Entry / Glance Screen	Short branded opening before entering the site
2	Home	Brand overview, collections, new arrivals, navigation and social links
2	Collections	All 8 major collections
3	Collection Category	One collection with 5 types, images and taglines
4	Product / Item Card	Description, quantity, Add to Cart and Buy Now
2	Cart	Items added by the user and quantity/total management
2	Profile	User/account area for the shopping-style interface
2	History	Previous order/activity area; can be represented as a frontend prototype initially
2	Contact	Contact details and enquiry pathway
2	Social Media	Links/icons to the boutique's social platforms

6. Entry / Glance Screen

Purpose: Give the visitor a quick, elegant introduction to Yazhi Collection before the main website appears.

- Brand name/logo: Yazhi Collection.
- Short premium tagline and/or one-line brand statement.
- Large boutique/fashion visual or full-screen background.
- Subtle entrance animation such as fade, scale or reveal; keep it short and smooth.
- Primary CTA: “Enter Collection” / “Explore Yazhi Collection”.
- After the CTA is selected, transition smoothly to the Home page.
- The intro must not trap the user: provide a clear way to enter and avoid long loading animations.

7. Home Page Requirements

Area	Required content / behavior
Header	Yazhi logo/wordmark, Home, Collections, New Arrivals, About/brand area, Contact, and utility icons for Cart, Profile and History.
Hero	High-impact boutique image, short brand description, primary CTA to explore collections. Optional secondary CTA for New Arrivals.
Brand description	Short statement explaining Yazhi Collection as an elegant women's fashion/boutique destination.

Collections preview	Visually attractive cards/circles for the major collections. Clicking "Collections" in the navigation must open the dedicated Collections page.
New Arrivals	Product cards with image, name, short description/price placeholder and action.
Shopping utilities	Cart, Profile and History should be visible and easy to reach from the header.
Customization message	A visible boutique message encouraging users to enquire about other colors or customization.
Social media	Instagram/YouTube/Facebook or other official links can be displayed in a social section and footer.
Footer	Logo, quick links, collection links, contact, social icons, policies/placeholders and copyright.

8. Navigation & User Flow

Primary rule: Navigation should be smooth, obvious and consistent across all pages.

- Home → Collections: opens the dedicated Collections page, not an in-page section only.
- Collections → Bridal/Festive/Party/Ethnic/Custom Design/Saree Collection/Combos/Contemporary: each opens its own collection page.
- Collection page → Type: each of the 5 types presents its own image and tagline; the type can lead into its product listing/details.
- Product → Add to Cart: adds the selected quantity to the cart and gives visible feedback.
- Product → Buy Now: proceeds to a purchase/checkout-style flow for the selected item in this frontend prototype.
- Header Cart/Profile/History icons remain easy to access without forcing the user to return Home.
- Use smooth scrolling for same-page sections and page transitions/active states for page-to-page navigation.
- On mobile, use a clean hamburger menu with the same destinations.

9. Collections Page

Major collections: Bridal, Festive, Party, Ethnic, Custom Design, Saree Collection, Combos and Contemporary.

The Collections page should visually introduce all 8 collections using cards or editorial blocks. Each collection must have a representative reference photo/visual, title and short introductory text. Clicking a collection must navigate to its dedicated page.

10. Collection Category Page — Common Template

Every major collection page should follow the same structure so users understand the website immediately.

- Collection hero: collection name, short introduction and a strong reference image.
- Five collection types displayed as five visually distinct cards/sections.
- Each type must show its title, reference/product photo and the exact tagline supplied in this PRD.
- Below each type, show relevant products/items.
- Each product must include image, product name, description, price placeholder if applicable, quantity controls, Add to Cart and Buy Now.
- Show a customization note near the product grid: *“Love this design in another color? Tell us your preference — we can explore a customized color or styling option for you.”*
- Use consistent CTA styling and visible success feedback after Add to Cart.
- Include a Back to Collections / breadcrumb path so users can return easily.

Bridal

Type	Tagline
Kanchipuram Silk Sarees	Traditional South Indian bridal wear with rich zari work.
Bridal Lehenga	Popular for engagement, reception and North Indian-style weddings.
Designer Bridal Sarees	Modern sarees with embroidery, sequins, stone and zari work.

Couple Outfit Combo	Two Styles, One Beautiful Story
Family Matching Combo	Together in Style, Together in Love
Men & Women Combo	Effortless Style, Perfectly Paired

Contemporary

Type	Tagline
Co-ord Sets	One Look, Perfectly Paired
Western Dresses	Modern Style, Effortless Grace
Tops & Shirts	Everyday Style, Elevated
Casual Wear	Relaxed Looks, Refined Style
Evening Wear	Own the Night in Style

11. Product Card & Interaction Requirements

- **Image:** clear fashion/product photo with consistent aspect ratio.
- **Title:** concise product name.
- **Description:** material/style/occasion information appropriate to the item.
- **Price:** display actual price when product data is available; otherwise use a clearly marked placeholder during development.
- **Quantity:** minus and plus controls with a visible numeric value. Prevent quantity from dropping below 1 when an item is selected.
- **Add to Cart:** update cart state and show feedback such as “Added to your cart.”
- **Buy Now:** open a checkout/purchase-style page or modal in the frontend prototype.
- **Customization:** provide a small “Need another color or customization?” enquiry CTA.
- **Hover/focus:** subtle image lift, border or shadow; do not over-animate.

12. Cart, Profile & History — Initial Frontend Scope

Cart: List selected products, image, name, quantity controls, price, remove action and subtotal/total. Persist cart state during the current browser session using JavaScript/localStorage.

Profile: Frontend account screen with name/email placeholders, saved preferences and basic profile UI. Real authentication is outside the initial localhost scope unless later requested.

History: Frontend order-history layout showing sample/persisted order records. Real payment/order backend is outside this phase.

Contact: Boutique contact details, enquiry form UI, social links and optional location/map area. Form validation can be handled in JavaScript.

13. JavaScript Requirements

- Entry-screen transition to Home.
- Mobile navigation open/close.
- Active navigation state where appropriate.
- Smooth scrolling for same-page anchors.
- Collection/product filtering or category interactions where useful.
- Quantity increment/decrement.
- Add to Cart and cart count update.
- Remove/update cart items.
- localStorage for cart persistence during the frontend prototype.
- Buy Now interaction.
- Basic form validation for contact/customization enquiry.
- Toast/notification feedback for actions.

14. Responsive & Accessibility Requirements

- Desktop-first visual richness with proper tablet and mobile adaptation.
- Navigation must remain usable on small screens.
- Images should scale without distortion.
- Buttons must have sufficient size and clear hover/focus states.
- Text must maintain readable contrast against backgrounds.
- Do not place important text only inside images.
- Use semantic HTML elements where practical: header, nav, main, section, article, footer.
- Provide alt text for meaningful product and collection images.

15. Recommended Project Structure

```

16. Content & Image Requirements

- The user will provide/add final home-page and collection/product images as needed.
- Use consistent image dimensions/aspect ratios for product cards.
- Use optimized images to keep localhost loading smooth.
- Do not stretch or crop important fashion details.
- Where real product images are not yet available, use clearly identified temporary placeholders rather than broken image icons.
- Each major collection should have at least one strong reference/hero visual plus images for its five types.

17. UX & Visual Quality Rules

- The website should feel premium, not crowded.
- Use generous spacing around headings, cards and sections.
- Use one consistent button language throughout the site.
- Gold should be an accent, not the dominant background color.
- Use shadows and borders subtly; avoid excessive glow effects.
- Use consistent card radius, image ratios and spacing.
- Keep the most important CTA visible and visually distinct.
- Do not overload the home page with every product. Use featured products and guide users into Collections.
- Maintain a clear visual hierarchy: brand → headline → supporting text → CTA → content.

18. Functional Acceptance Criteria

1. Opening the site shows the Yazhi Collection glance/entry experience before Home.
2. The user can enter the Home page through a clear CTA.
3. Home contains the brand/logo, description, collection access, new arrivals, cart, profile, history, contact and social media access.
4. Clicking Collections from Home opens a dedicated Collections page.
5. The Collections page contains exactly these major groups: Bridal, Festive, Party, Ethnic, Custom Design, Saree Collection, Combos and Contemporary.
6. Clicking a major collection opens its own page.
7. Each major collection contains five types with an image/reference visual and tagline.
8. Products can show description and quantity controls.
9. Add to Cart changes the cart state/count.
10. Buy Now has a visible frontend interaction.
11. Customization messaging is available for alternative colors/custom requests.
12. Navigation works consistently across desktop and mobile layouts.
13. No broken links, broken images or dead buttons remain in the final demo.

19. Out of Scope for Version 1

- Real payment gateway.
- Real backend database.
- Production authentication/authorization.
- Real inventory management.
- Real-time order tracking.
- Admin dashboard.
- Server-side checkout and payment confirmation.
- Automated delivery/shipping integration.

These can be added later if the internship task expands from a localhost frontend prototype into a full-stack application.

20. Suggested Future Enhancements

- Backend API and database for products, users, orders and inventory.
- Real login/signup and profile management.
- Wishlist and product comparison.
- Search, filters, sort and size/color selection.
- Product detail page with image gallery.
- Online payment integration.
- WhatsApp/customization enquiry integration.
- Admin panel for adding collections and products.
- Real customer reviews and ratings.

21. Final Product Vision

Yazhi Collection should present itself as a **premium, elegant and modern women's boutique** with a strong Indian fashion identity. The first impression should be visual and memorable, while the actual navigation should remain simple and practical.

The key experience is intentionally hierarchical: **Glance → Home → Collections → Collection → Type → Product → Cart/Buy Now**. This keeps the website easy to understand while still giving it the depth expected from a professional boutique site.

The first implementation should prioritize polished UI, responsive layout, clear navigation and working frontend interactions. Real backend, authentication and payments can be introduced in a later phase.
